Art Unit: 2168

DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 1-3, 5, 7-14, 16-19, and 21-32 are rejected under 35 U.S.C. 102(b) as being anticipated by <u>Aslam et al</u> (Aslam, Javed; Pelekhov, Katya; Rus, Daniela; Static and Dynamic Information Organization with Star Clusters, 1998, Department of Computer Science, Dartmouth College, Hanover, NH, 10 pages).

As to claims 1 and 17, <u>Aslam et al</u> teaches a software method in a computer system for automatically analyzing relationships between target and source documents (p. 2 col. 1 line 58 through p. 2 col. 2 line 2), comprising the steps of:

receiving an autolink command by a link analysis server from an application program (p. 4 col. 2 line 7 through p. 5 col. 1 line 3);

accessing a processing profile identified in the autolink command (p. 5 col. 1 lines 1-3, processing profile is read on query, because both provide information regarding how an autolink command is to be processed);

accessing source and target document data identified in the autolink command

Art Unit: 2168

(p. 5 col. 1 lines 2-3, source and target document data is read on several corpora); performing a link analysis for identifying relationships based on comparing similarity scores between target and source documents (p. 5 col. 1 lines 6-9); and sending a response containing a link analysis result to the application program (p. 5 col. 1 lines 6-9).

As to claims 2 and 18, <u>Aslam et al</u> teaches the step of receiving comprises receiving an autolink command by a link analysis server from a user interface program connected to the link analysis server (p. 4 Figure 3, showing a user interface for sending an autolink command)

As to claims 3 and 23, <u>Aslam et al</u> teaches the step of accessing a processing profile further comprises:

identifying an options element (p. 5 col. 1 lines 2-3);

identifying a threshold limit element defining a path to threshold limit values (p. 2 col. 2 lines 28-30);

identifying a mapping element for defining mappings between source and target document data (p. 5 col. 1 lines 2-3, specifying corpora containing source and target documents to be analyzed for links);

identifying an output element for defining output attributes including detail level 1, detail level 2, detail level 3, detail level 4, persistence level 1, persistence level 2, persistence level 3, persistence level 4; and identifying a datasource element for

Art Unit: 2168

defining a persistence data source (p. 5 col. 1 lines 20-22).

As to claim 5 and 19, <u>Aslam et al</u> teaches the step of accessing a processing profile comprises accessing a processing profile embedded online in the autolink command (p. 5 col. 1 lines 1-3, processing profile is read on query, because both provide information regarding how an autolink command is to be processed).

As to claim 7, <u>Aslam et al</u> teaches the source document data comprises an inline designation attribute, one or more source document key attributes, a no-source attribute for indicating target documents are compared to each other, a query attribute, a database attribute, a cache designation attribute, and a block size attribute (p. 5 col. 1 lines 1-3).

As to claim 8, <u>Aslam et al</u> teaches the step of accessing source document data comprises accessing source document data embedded inline with the autolink command (p. 5 col. 1 lines 2-3, source document data is equivalent to information specifying several corpora, because both pieces of information identify source documents).

As to claim 9, <u>Aslam et al</u> teaches the step of accessing source document data comprises accessing source document data from a similarity search server by issuing a query command to the similarity search server from the link analysis server (p. 4 col. 2

line 7 through p. 5 col. 1 line 2).

As to claim 10, <u>Aslam et al</u> teaches the target document data comprises an inline designation attribute, one or more source document key attributes, a query attribute, a database attribute, a cache designation attribute, and a block size attribute (p. 5 col. 1 lines 1-3).

As to claim 11, <u>Aslam et al</u> teaches the step of accessing target document data comprises accessing target document data embedded inline in the autolink command (p. 5 col. 1 lines 2-3, target document data is equivalent to information specifying several corpora, because both pieces of information identify target documents).

As to claim 12, <u>Aslam et al</u> teaches the step of accessing target document data comprises accessing target document data from a similarity search server by issuing a query command to the similarity search server from the link analysis server (p. 4 col. 2 line 7 through p. 5 col. 1 line 2).

As to claim 13, <u>Aslam et al</u> teaches the step of performing a link analysis for identifying relationships is based on a comparison selected from the group consisting of:

comparing one source document with many target documents (p.4 col. 2 lines 7-8, since the system has the capability of running on a specified subcollection, inherently, it has the capability of running on a specified subcollection consisting of a

single document);

comparing multiple source documents with multiple target documents in different groups (p. 4 col. 2 line 7 through p. 5 col. 1 line 2, run on specific subcollection); and comparing multiple documents within a group with each other (p. 4 col. 2 line 7 through p. 5 col. 1 line 2, run on whole collection).

As to claim 14, <u>Aslam et al</u> teaches the step of sending a response is selected from the group consisting of (the use of the wording "a response is selected from the group consisting of" necessitates that only one of the options be taught by the prior art for rejection of this claim):

sending a response containing an error message;

sending a response containing a count of link matches;

sending a response containing a count of link matches and source documents; sending a response containing a count of link matches, source documents, and document scores that were used in a link match result (p. 5 col. 1 lines 6-9, the most relevant documents and document-to-document similarity information is provided. A count of the documents is inherent in the list of most relevant documents, since the number of documents belonging to this list is the count. Document score is read on document-to-document similarity information; p. 3 col. 1 lines 43-45 indicates a score between documents. Source documents are contained in the document-to-document similarity information, since this information shows the similarity between documents, including any documents that happen to be in the set of source documents.); and

Art Unit: 2168

sending a response containing a count of link matches, source documents, document scores and document attribute scores that were used in a link match result.

As to claim 16, <u>Aslam et al</u> teaches containing instructions for controlling a computer system according to the software method of claim 1 (p. 4 col. 1 lines 2-4, the method is implemented as a computer system, which inherently includes a computer-readable medium containing instructions for controlling a computer system).

As to claim 21, <u>Aslam et al</u> teaches the source document is accessed from a similarity search server (p. 4 col. 1 lines 7-8, search server is read on search engine).

As to claim 22, <u>Aslam et al</u> teaches the target data is accessed from a similarity search server (p. 4 col. 1 lines 7-8, search server is read on search engine).

As to claim 24, <u>Aslam et al</u> teaches the means for receiving an autolink command comprises an input processing section of the link analysis server (p. 5 col. 1 lines 1-6, an input processing section is inherent, since the system has the capability to receive and process input).

As to claim 25, <u>Aslam et al</u> teaches the means for accessing the processing profile, the source document data and the target document data comprises a data

Art Unit: 2168

manager section of the link analysis server (p. 5 col. 1 lines 1-6, a data manager section is inherent, since the system has the capability to access a processing profile).

As to claim 26, Aslam et al teaches the means for performing a link analysis comprises an engine manager section containing an engine core within the link analysis section (p. 5 col. 1 lines 6-13, an engine manager section containing an engine core within the link analysis section is inherent, since the system has the capability to perform link analysis).

As to claim 27, <u>Aslam et al</u> teaches the means for sending a response is an output section of the link analysis server (p. 5 col. 1 lines 6-9, an output section is inherent, since the system has the capability to output the results of link analysis).

As to claim 28, <u>Aslam et al</u> teaches a data persistence section of the link analysis server for storing response results (p. 5 col. 1 lines 6-9, a data persistence section is inherent, since the system has the capability to store the results of link analysis).

As to claim 29, <u>Aslam et al</u> teaches a software method in a computer system for automatically analyzing relationships between target and source documents (p. 2 col. 1 line 58 through p. 2 col. 2 line 2), comprising the steps of:

Art Unit: 2168

receiving an autolink command by a link analysis server from a requesting application designating a processing profile, target documents and source documents (p. 4 col. 2 line 7 through p. 5 col. 1 line 3);

accessing the processing profile from a database (p. 5 col. 1 lines 1-3, processing profile is read on query, because both provide information regarding how an autolink command is to be processed);

accessing similarity scores between attributes of the target documents and attributes of the source documents from a similarity search server (p. 5 col. 1 lines 1-3, processing profile is read on query, because both provide information regarding how an autolink command is to be processed);

linking target document attributes and source document attributes within the link analysis server based on comparative values of attribute similarity scores (p. 5 col. 1 lines 6-9);

sending results of the linking step to the requesting application (p. 5 col. 1 lines 6-9); and

saving the results in a persistence database (p. 5 col. 1 lines 6-11, inherently, the results must be stored as an intermediate step before the results are provided as input).

As to claim 30, <u>Aslam et al</u> teaches the processing profile is embedded inline in the autolink command (p. 4 col. 2 line 7 through p. 5 col. 1 line 3, issuing a query is equivalent to an autolink command, since both initiate link analysis. A query is

equivalent to a processing profile, since it determines which data are to be processed, and how that data will be processed.).

As to claim 31, <u>Aslam et al</u> teaches the target document attributes and associated schema are embedded inline in the autolink command (p. 5 col. 1 lines 2-3, target document data is equivalent to information specifying several corpora, because both pieces of information identify target documents).

As to claim 32, <u>Aslam et al</u> teaches the source document attributes and associated schema are embedded inline in the autolink command (p. 5 col. 1 lines 2-3, source document data is equivalent to information specifying several corpora, because both pieces of information identify source documents).

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claim 4 is rejected under 35 U.S.C. 103(a) as being unpatentable over <u>Aslam et al</u> (Aslam, Javed; Pelekhov, Katya; Rus, Daniela; Static and Dynamic Information
 Organization with Star Clusters, 1998, Department of Computer Science, Dartmouth

College, Hanover, NH, 10 pages), in view of <u>Apte et al</u> (U.S. Patent Number 6,654,739 B1).

As to claim 4, <u>Aslam et al</u> does not explicitly teach specifying a stop-on count attribute;

specifying an analysis-type attribute, including single, multiple, and group values; specifying a count-type attribute, including match-count, statistical, and threshold; specifying a minimum and maximum number of document links to be found; specifying threshold limits for defining ranges of similarity scores for indicating linked relationships, including attributes greater-than, greater-than-and-equal-to, less-than, less-than-and-equal-to, equal-to, and not-equal-to; and

specifying scoring aggregation options, including attributes include-minimum, include-maximum, and average-top-N-scores.

Apte et al teaches specifying a stop-on count attribute (col. 4 lines 26-27); specifying an analysis-type attribute, including single, multiple, and group values (col. 4 lines 28-29);

specifying a count-type attribute, including match-count, statistical, and threshold (col. 5 lines 59-60);

specifying a minimum and maximum number of document links to be found (col. 4 lines 26-27, where the single value k acts as both a minimum and maximum, since exactly k matching documents are computed);

specifying threshold limits for defining ranges of similarity scores for indicating

Art Unit: 2168

linked relationships, including attributes greater-than, greater-than-and-equal-to, less-than, less-than-and-equal-to, equal-to, and not-equal-to (col. 5 lines 58-60); and specifying scoring aggregation options, including attributes include-minimum, include-maximum, and average-top-N-scores (col. 5 lines 58-60).

Therefore, it would have been obvious to one skilled in the art at the time the invention was made to have modified the method of analyzing relationships between documents taught by <u>Aslam et al</u> by the method of computing a similarity score taught by <u>Apte et al</u>, because specifying a maximum number of document links to be found enables efficient computation of the links (<u>Apte et al</u> col. 4 lines 33-35).

5. Claims 6, 15, and 20 are rejected under 35 U.S.C. 103(a) as being unpatentable over <u>Aslam et al</u> (Aslam, Javed; Pelekhov, Katya; Rus, Daniela; Static and Dynamic Information Organization with Star Clusters, 1998, Department of Computer Science, Dartmouth College, Hanover, NH, 10 pages), in view of <u>Lam et al</u> (U.S. Patent Publication 2003/0220858 A1).

As to claims 6 and 20, <u>Aslam et al</u> does not explicitly teach the step of accessing a processing profile comprises accessing a processing profile from a persistence database.

<u>Lam et al</u> teaches the step of accessing a processing profile comprises accessing a processing profile from a persistence database (ines 1-2 of paragraph [0121], accessing a stored link).

Therefore, it would have been obvious to one skilled in the art at the time the invention was made to have modified the method of analyzing relationships between documents taught by <u>Aslam et al</u> by the step of storing links between similar records taught by <u>Lam et al</u>, because storing links allows the links to be used later (<u>Lam et al</u> lines 1-2 of paragraph [0121]).

As to claim 15, <u>Aslam et al</u> does not explicitly teach the step of storing the response containing the link analysis result in a persistence database.

Lam et al teaches the step of storing the response containing the link analysis result in a persistence database (lines 16-17 of paragraph [0120] and lines 1-2 of paragraph [0121], item 112 in Figure 1, indicating links produced as a result of a matching process are stored in a database).

Therefore, it would have been obvious to one skilled in the art at the time the invention was made to have modified the method of analyzing relationships between documents taught by <u>Aslam et al</u> by the step of storing links between similar records taught by <u>Lam et al</u>, because storing links allows the links to be used later (<u>Lam et al</u> lines 1-2 of paragraph [0121]).

Conclusion

6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Application/Control Number: 10/707,017 Page 14

Art Unit: 2168

U.S. Patent Number 6,167,397, issued to Jacobson et al, for teaching a method
of clustering documents in response to a query.

 U.S. Publication 2003/0172058 A1, issued to Namba, for teaching a method of calculating similarity between documents.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Paul J. Sommerfeld whose telephone number is 571 272-6545. The examiner can normally be reached on M-F 7:45 am - 4:15pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Tim T. Vo can be reached on 571 272-3642. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only.
